

Why Oatmeal is Cheap

A Fundamental Theorem for Procedural Generators

$$|G^*| \geq K^*(G) - p(G) \geq 0$$

Procedural Content Generation and Oatmeal

Procedures that make something

BAKE THE PERFECT COOKIE

What's the difference between crisp and cakey chocolate chip cookies?
Just a slight modification to the amount of butter and sugar.

THIN & CRISP

2½ sticks unsalted butter, softened
1¼ cups granulated sugar
¾ cup brown sugar

SOFT & CHEWY

2 sticks unsalted butter, softened
½ cup granulated sugar
1 cup brown sugar

LIGHT & CAKEY

1¾ sticks unsalted butter, softened
¾ cup granulated sugar
¼ cup brown sugar

PLUS ...

2¼ cups all-purpose flour
½ teaspoon baking soda
1 teaspoon coarse salt
2 teaspoons pure vanilla extract
2 large eggs, room temperature
2 cups (about 12 ounces) chocolate chips

- Preheat oven to 350 degrees. In a bowl, whisk together flour and baking soda. In another bowl, beat butter with both sugars until fluffy. Beat in salt, vanilla and eggs until well combined. Mix in flour mixture until just combined. Stir in chips.
- Drop tablespoon-size balls of dough 2 inches apart onto parchment-lined baking sheets.
- Bake until cookies are golden around edges but still soft in center, 8 to 10 minutes. Transfer to a wire rack; let cool.

Three reasons to start a succulent garden

1. Succulents are low-maintenance: They don't require much watering or fertilizing, and they can tolerate a wide range of light conditions.
2. Succulents are drought-tolerant: They're perfect for areas that receive little rainfall or irrigation.
3. Succulents add interest and variety to the landscape: With their wide range of shapes, sizes, and colors, they can provide a unique and eye-catching addition to any garden.

The 10.000 bowls of Oatmeal problem

These bowls of oatmeal are all technically unique...

...but they taste exactly the same.

Margaret W Tarrant - Illustration of Goldilocks

(sometime Oatmeal is fine)

Fundamental theory as a bridge

PCG is extensively studied empirically, but rarely on a fundamental mathematical level

- I. 3 mathematical properties of generators
→ 3 intuitive concepts used by designers
- II. a fundamental theorem made of 3 inequalities
→ insight about the challenges of designing generators

Definitions

What we're studying: Ideal Generators

an **ideal** generator G has these properties:

- ★ **Terminability** : It always outputs something
- ★ **Fixed Input Size**: It accepts input of a specific length
- ★ **Injectivity** : Different inputs give different outputs

Inputs & Outputs are binary strings

0110010 → 011001001101010

We can take a non-ideal generator and turn into one that is ideal.

1. Length

```
--set palette
pal({1,8,3,9,14,4})
cls()
function _update()
  local x = rnd(128)
  local y = rnd(128)
  local e = t()
  for c=-2,1 do for r=-1,1 do
    local a=64+c*54+r%2*27
    local b=64+r*48
    line()
    -- draw hexagons
    for i=0,1,1/6 do
      line(a+sin(i)*30,b+cos(i)*30,7)
    end
    -- draw planets, bit by bit
    if(sqrt((x-a)^2+(y-b)^2) < 15+sin(c/7)*4+sin(r/2)*4)
      pset(x,y,2+c+r*2+sin(x/81+e)*2+cos(y/(14*c)))
    end
  end
end
end
```

(206 bytes)

$|G|$ is the length of G 's source code

```
pal({1,8,3,9,14,4})cls()s=sin::_::
x=rnd(128)y=rnd(128)e=t() for c=-2,1
do for r=-1,1do a=64+c*54+r%2*27b=64
+r*48line()for i=0,1,1/6do line(a+s(i)
*30,b+cos(i)*30,7)end if sqrt((x-a)^2+
(y-b)^2)<15+s(c/7)*4+s(r/2)*4) pset(x,y
,2+c+r*2+s(x/81+e)*2+cos(y/(14*c)))end
end goto _--
```

(140 bytes)

written as shortly as possible

→ Encoded Knowledge

Knowledge...

- Learn how to compose artefacts
- Specify a precise procedure to make them

... you have to Encode

- Implement the procedure
- Test it
- Debug it
- Document it
- Optimise it

It's costly.

2. Size of Possibility Space

Tea Garden's sprite generator

$P(G)$ is the number of unique artefacts in G 's possibility space.

$$P(G) = 100$$

$p(G)$ is the \log_2 of that number.

$$p(G) = \log_2(100) \approx 6.64$$

→ Scale

From Wikipedia, the free encyclopedia

Coordinates: 38°37′38″N 90°11′52″W

This article is about the city in Missouri, United States. For other uses, see St. Louis (disambiguation).

St. Louis (/ˈseɪnt ˈluːɪs, sənt ˈluːɪs/^[10]) is the second-largest city in Missouri, United States. It is located near the confluence of the Mississippi and the Missouri rivers. In 2020, the city proper had a population of 301,578,^[8] while its bi-state metropolitan area, which extends into Illinois, had an estimated population of over 2.8 million. It is the largest metropolitan area in Missouri and the second largest in Illinois.

Before European settlement, the area had been occupied for thousands of years by various Native American cultures. From roughly 900 to 1500 CE, it was a regional center of Mississippian culture, based in Cahokia east of the river, and extending across the continent along the Mississippi and its tributaries.

St. Louis

Independent city

Downtown St. Louis and the Old Courthouse (St. Louis) and Gateway Arch

$P(G)$ = Number of articles

$$C_1 + P(G) \cdot (C_0 + K^*(G)) \geq |G|$$

$K(G)$ = Average compressed size of an article

$$P(G) \cdot (K^*(G)) \geq |G|$$

$|G|$ = Size of Wikipedia's source code, compressed

$$P(G) \cdot (K^*(G)) \approx |G|$$

Estimation: $1.9e7$ pages * 2.5 Kb = 47 Gb

Size of Wikipedia's archive : 16 Gb

$P(G)$ = Number of different pictures

$$C_1 + P(G) \cdot (C_0 + K^*(G)) \geq |G|$$

$K(G)$ = Average compressed size of a picture

$$P(G) \cdot (K^*(G)) \geq |G|$$

$|G|$ = Size of StableDiffusion source code, compressed

$$P(G) \cdot (K^*(G)) \approx |G|$$

Estimation: 10 Gb / 1.26 Mb = 7900 different pictures

Thank you!
